Abstract of JP 11136533 (A)

PROBLEM TO BE SOLVED: To automatically correct the deterioration of pic ture quality owing to the fading of a develo ped still photograph film.
SOLUTION: A read part 331 for reading a standard pattern for fading correction on respec tive colors of R, G and B, which is previously printed in a part except for the image pickup part of the film, a fading judgment part 332 judging the d egree of the fading of respective R, G and B colo rs in the film based on the standard pattern for fading correction, which is read, a look-up table 333 w hich previously has plural tables for fading c orrection of R, G and B and reads the optimum table for fading correction in accordance with the judged result of the fadi ng judgment part 332 and a picture signal processing circuit correcting the R, G and B picture signals based on the table for fading correction, which is read, and outputting them to a video monitor are provided. Thus, a state without fading can always be reproduced even if the film picture of the developed still photograph film is faded.
